## Overview of Freemason Build System

Rafi Einstein November 2006

- Introduction
  - Rationale
  - Implementation Notes
- Requirements
- Architecture
- Module Definition
- Tool and Product Definitions
- Target Definitions
- Project Roadmap

LOM IONS EXF

MMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLE A RICHER COMMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLE A RICHER COMMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLE A RICHER COMMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLE A RICHER COMMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLE A RICHER COMMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLE A RICHER COMMUNICATIONS EXPERIENCE TO TAKE PLACEOUR PRODUCTS ENABLES.

#### Introduction

#### Rationale

- Standardization of the build process
  - Automation
  - Rigorous process
    - "Sourcification" of build methods
  - Use of canonical build tools
- Usability
  - Uniform build process interface (as much as possible)
    - For projects, targets, and tools
  - Work alongside of various IDEs
    - i.e., VS, Tornado, Eclipse
    - Reference for other build tools
    - Integration within the IDE

#### Rationale

- Low signature on most projects
  - Mostly declarative
- Arbitrary complexity where required
- Build performance
  - Use of pre-built modules: risks and benefits
  - Build parallelization

## *Implementation*

- Using GNU make (with extensions) as a primary engine
  - Extensions enable improved diagnosis
- Framework of makefiles
- Runs on Windows (native, Cygwin) and Linux
  - Wherever make, sh and Perl are available
- Medium-level learn curve for maintainers

- Introduction
- Requirements
- Architecture
- Module Definition
- Tool and Product Definitions
- Target Definitions
- Project Roadmap

### Requirements

## Requirements

- Multiple target platforms (Win32, VxW 5.5, VxW 6.3, Linux)
- Multiple host (builder) platforms (Windows, Linux)
- Usability
  - Concise operation
  - Complete automation
    - Source-to-Board by one command
- Simple module setup
  - Introduction of new modules, new source files
- Build system configurability
  - Targets
  - Tools
  - Builder hosts
- Dynamic module configuration
  - Source file selection
  - Compilation/Link options
  - Build variants

## Requirements

- Module dependencies
  - Specification of module dependencies
  - Shallow/Deep build
  - Use of pre-built modules
- File dependencies
  - Auto detection of C file dependencies
  - Generated source files (\*)
  - Precompiled headers (\*)
- Independence
  - Separation from host environment
  - Use of canonical build tools
- Traceability
  - Makefile hierarchy and preprocessing
  - Tool invocations and outputs
- IDE Integration
- Documentation

- Introduction
- Requirements
- Architecture
  - Concepts
  - Framework Structure
- Module Definition
- Tool and Product Definitions
- Target Definitions
- Project Roadmap

include \$(MK)/rules

## Module Attributes Specification

- Attributes
  - Module name
  - Module location
  - Product type
  - Module dependencies
  - Integration parameters
- Process
  - Deep build
    - Module dependencies are referenced in DFS order
  - Module artifacts are added to the proper tool argument variables
    - Can be overridden manually

## Module Attributes Sample

- Introduction
- Requirements
- Architecture
- Module Definition
- Tool and Product Definitions
  - Generic Tool
  - CC Tool
  - Product Definitions

# Tool and Product Definitions

## Generic Tool Specification

- builder-host/HOST/<localhost-TOOL-defs>
- tool/TOOL
  - target-arch/ARCH
  - target-os/OS
  - product/PRODUCT
    - target-arch/ARCH
    - target-os/OS
- Dispatchers are tool/defs and tool/rules
  - Unless we use CC tool

#### CC Tool

- Structure is similar to that of a generic tool
- Extra services
  - Uniform preprocessing
  - Compilation rules
  - Automatic source file dependencies generation
  - Construction of directories for binary files
- Tool selected by setting CC\_TOOL
  - Implicitly, TOOL is set to CC

#### In project configuration file:

ifeq (\$(TARGET\_OS),win32)
CC\_TOOL=msc-12
else ifeq (\$(TARGET\_OS),vxworks-5.5)
CC\_TOOL=diab-5.0
endif

#### **Product Definitions**

- Products
  - Program, Library (.a/.lib), Shared Object (.so/.dll), FLS, RPM, Java Jar, .Net Assembly, etc.
- Template
  - product/PRODUCT
    - target-arch/ARCH
    - target-os/OS
- Instances
  - product
  - module/product
  - tool/TOOL/product
  - tool/cc/product

- Introduction
- Requirements
- Architecture
- Module Definition
- Tool and Product Definitions
- Target Definitions
- Project Roadmap

## Target Definitions

## Target Classification

- target-arch/ARCH
  - Typically, CPU of the target
    - Open Issue!
  - If not specified, (HOST\_ARCH) is used
- target-os/OS
  - If not specified, (HOST\_OS) is used
- target-platform/PLATFORM
  - Typically specifies Architecture, OS, and build tools
  - Build tools can also be specified in a project common definitions file, based on the selected platform
  - If not specified, (TARGET\_OS)-(TARGET\_ARCH) is used

## Project Roadmap

## Project Roadmap

- Iterations
  - Refinement of Freemason features
  - Setup of MCU Windows and VxWorks 5.5 build environments
- Setup of TAMAR-related facilities
  - VxWorks 6.3 target
  - Diab 5.4 tools
  - MCU VxWorks 6.3 build environment

## Project Roadmap

- IDE integration
- Build parallelization
  - make -j
  - distcc, ccache
  - Incredibuild (not likely)
